

Map Website

Product Brief · AI Builder Space Proseminar

Pedro Silva, Rob Hefferon · October 1, 2026

Type: A web app: an interactive map website that lets users generate custom running routes, find public bathrooms, and find restaurants that fit their criteria.

Map Website is one interactive map for runners who love food and are new to a city. It brings custom running routes, public bathrooms, and authentic local restaurants together in one place.

The Idea & The User

Map Website is an interactive web map for “foodie runners”: people visiting a new city or recently moved to one, who care about both their run and their next meal. In an unfamiliar place, no easy, interactive website brings together the three things these users need most. Map Website lets them generate custom running routes, find public bathrooms, and find restaurants that match their personal criteria, all on one map.

This combines existing tools with something new. No website currently maps publicly accessible bathrooms or points specifically to quintessential local restaurants serving the region’s cuisine. That knowledge is scattered across review sites, Reddit, and Google reviews. Map Website pulls it into one place, so a newcomer can plan a run, a bathroom stop, and a meal without jumping between sources.

Does this exist already?

Parts of this exist, but not in one place. Strava generates running routes, but it offers limited customization and sits behind a paywall. Foodies looking for authentic local restaurants rely on Reddit and other forums. Those give written reviews with no map, and the useful advice is split across each city’s local subreddit instead of one central source. Restroom-finder apps exist, but they rely on users to update them by hand, so their coverage is incomplete.

We believe Map Website will be a real improvement because it simplifies settling into a new city: one map for runs, bathrooms, and local food. We are also building it on purpose, to learn.

Scope for this sprint

The smallest useful version is a web map with two working features, route generation and restaurant search, run separately.

MUST-HAVES

- 📍 Running route generator with adjustable distance, start point, loop or out-and-back, and elevation
- 📍 Restaurant finder filtered by price range and "quintessential local" picks
- 📍 Restaurant quality based on established sources (e.g., Michelin) rather than Google star ratings alone

OUT OF SCOPE

- 📍 Public bathroom finder (planned later as a sub-feature of route planning)
- 📍 Showing restaurants along or near a generated route
- 📍 User accounts, and saving or sharing routes
- 📍 User-submitted reviews
- 📍 Mobile app (a possible stretch goal, depending on effort)

Launch area (Boston only or global) depends on which is easier to build. That will be tracked as an open question.

📍 Success

By the end of the sprint, we will test both core features with real people. First, Map Website will generate a restaurant recommendation list, and a local expert will review it. Success means the expert approves at least 90% of the list. Second, a test user will run a route the site generated and confirm that it works as planned. The expert and test runner are still to be chosen.

📍 Open questions or risks

Several decisions are still open. The project needs a permanent name to replace "Map Website." We have not yet decided whether to launch in Boston only or globally; that will depend on which is easier to build. We still need to recruit the local food expert and the test runner for our success checks. Finally, for the later bathroom feature, we need a way to get more complete data than existing user-updated apps offer.
